

autodie::exception::system(3pm)

autodie::exception::system(3pm) User Contributed Perl Documentation autodie::exception::system(3pm)

NAME

autodie::exception::system - Exceptions from autodying system().

SYNOPSIS

```
eval {
    use autodie qw(system);
    system($cmd, @args);
};
if (my $E = $?) {
    say "Ooops! ", $E->caller, " had problems: $?";
}
```

DESCRIPTION

This is a `autodie::exception` class for failures from the “system” command.

Presently there is no way to interrogate an “`autodie::exception::system`” object for the command, exit status, and other information you’d expect such an object to hold. The interface will be expanded to accommodate this in the future.

stringify

When stringified, “`autodie::exception::system`” objects currently use the message generated by `IPC::System::Simple`.
